

In the Spring time birds like to make a home in our chimneys, as chimneys can supply them with the heat from our homes to raise their eggs. Unfortunately this can be very dangerous for fireplaces that are in use as it can block the flue resulting in the chimney not drawing effectively. The most common signs of this are twigs in the fireplace or feathers or the smoke backing up in the room. A blockage can be very harmful especially if you have a gas or Park ray type fire because of the emission of carbon monoxide. The chimney of an open fire may become blocked resulting in smoke entering the room or even a potential chimney fire.

If you think there is a blockage or a nest in your chimney, please feel free to give us a call to discuss the problem. We can remove most blockages and give you advice on how to prevent it from happening again or even install a Bird Guard Cowl to stop them from coming back.

We will not remove nests during the breeding season (May & June) to ensure that the young have left the nest as otherwise they could be harmed or even fall from the nest.
